```
%/*
%** Copyright 1997,1998 EMC Corporation
%*/

/*
**  Leading % causes rpcgen to pass a line directly thought to the output,
**  ie restore_engine.h in this case.  This allows the .h to make a little
**  more sense and be properly documented.
*/

%/*
% * restore_engine.x : EDM Restore Engine C/S communication module
% *
% * Mission Statement:  This is an RPCGEN file which defines the RPC interface
% *                     between the Restore Engine server (which resides on
% *                     the EDM server) and  the backup client callers of its
% *                     functions.  This defines the RPC level calls that a
% *                     "caller" can make and the "service" will respond to.
% *
% * Primary Data Acted On: This defines the data that will flow over the wire.
% *                        The RPC mechanism will take care of data
                                                              marshalling
% *
% *
% * Compile-Time Options:
% *                       This acutally gets run through RPCGEN not compiled.
                                                                      It
% *                        must be run through with the -h flag to create a
% *                        header, the -m flag to create the service side
% *                        routines, the -l flag to create the client side
% *                        routines, and the -c flag to create the common data
% *                        marshalling routines.
% *
% * Basic idea here:
% *                       Define the RPC level interfaces to the Restore Engine
% *                       and all data types that will be passed via RPC.

/*****************************************************************
 * EDMRST_GetTopLevelObjects:
 *
 *  This function is provided to allow retrieval of the
 *  work items which are restorable for the given client.
 *
 * It is a GOAL of this routine to return all work-items ever backed
 * up successfully.  Currently, though, it only looks in the config
 * file for work-items of the given client.
 *
 * The cookie must be initialized to INIT_COOKIE on the first call to this
 * routine. This routine will update the cookie to allow retrieval of more
 * objects if there are more than "maxEntries".  The cookie will be
 * returned as DONE_COOKIE when there are no more to retrieve.
 *
 * Parameters:
 *   svrHdl         (I)   - A pointer to this user's client handle for the
 *                          Restore Engine (server) connection.
 *   sourceHost     (I)   - the name of the source host being restored
 *   maxEntries     (I)   - the maximum number of objects to return
 *   topLevObjs     (O)   - ptr to pre-allocated array of restorableObject
 *                          buffer ptrs
 *   numberEntries (O)    - the real number of objects returned in the array
 *   cookie         (IO)  - a place holder for the list position
 *                          meaningful to only the internals of the API
 *

/*****************************************************************
 * EDMRST_GetAllTopLevelObjects:
 *
 *  This function is provided to allow retrieval of the
 *  work items which are restorable for the given client.
 *
 *  It is a GOAL of this routine to return all work-items ever backed
 *  up successfully.  Currently, though, it only looks in the config
 *  file for work-items of the given client.
 *
 *  The cookie must be initialized to INIT_COOKIE on the first call to this
 *  routine. This routine will update the cookie to allow retrieval of more
 *  objects if there are more than "maxEntries".  The cookie will be
 *  returned as DONE_COOKIE when there are no more to retrieve.
 *
 * Parameters:
 *   svrHdl         (I)   - A pointer to this user's client handle for the
 *                          Restore Engine (server) connection.
 *   sourceHost     (I)   - the name of the source host being restored
 *   maxEntries     (I)   - the maximum number of objects to return
 *   topLevObjs     (O)   - ptr to pre-allocated array of restorableObject
 *                          buffer ptrs
 *   numberEntries (O)    - the real number of objects returned in the array
 *   cookie         (IO)  - a place holder for the list position
```

```
 *                          meaningful to only the internals of the API
 *

/*****************************************************************
 * EDMRST_GetRestorableObjects API
 *
 *    Function Description:
 *
 * Given a parent (i.e. container) restorable object, return the children
 * restorable objects it contains.
 *
 * The cookie must be initialize to INIT_COOKIE on the first call to this
 * routine. This routine will update the cookie to allow retrieval of more
 * objects if there is more than "maxEntries".  The cookie will be
 * returned as DONE_COOKIE when there are no more to retrieve.
 *
 *    Parameters:
 *       svrHdl          - (I) A pointer to this user's client handle for the
 *                           Restore Engine (server) connection.
 *       parentPtr       - (I) ptr to parent restorableObject
 *       allowBF                 - (
 *                           I) flag indicating whether or not to include bad
 *                           files
 *       maxEntries      - (I) max. # of entries that the preallocated buffer
 *                           can hold
 *       objBufPtr       - (O) ptr to preallocated array of restorableObject
 *                           buffer ptrs
 *       numEntries      - (O) ptr to buffer to receive number of entries
 *                           returned in objBufArray
 *       cookie          - (
 *                         I/O) ptr to a long integer whose value is meaningful
 *                              to only the internals of the API
 *
 *                              == INIT_COOKIE: initial query input
 *                              == DONE_COOKIE: end of query output
 *
 *  Return Codes:
 *       E_SUCCESS       - operation completed successfully
 *
 *       EP_RB_RECOVER_INVAL_OBJNAME     - input restorableObject does
 *                                         not have a valid name;
 *       EP_RB_RECOVER_BAD_ARGS          - input restorableObject ptr
 *                                         or objBufPtr is NULL;
 *       EP_RB_RECOVER_BAD_COOKIE        - input cookie ptr is NULL or
 *                                         the cookie is DONE_COOKIE;
 *       EP_RB_RECOVER_INVALOP           - the call is issued without
 *                                         the correct context setup;
 *
 *       return codes from GetWorkItemContents() and from
 *       GetDirContents().

 *
 * EDMRST_SetPrevBackup API
 *
 * Function Description:
 *       Set the restore_context to that of the previous backup with respect
 *       to the current one.
 *
 * Parameters:
 *  svrHdl (I) - A pointer to this user's client handle for the
 *               Restore Engine (server) connection.
 *  flags  (I) - Selection Flags: e.g., Complete backups only/partial ok
 *
 * Return Codes:
 *       E_SUCCESS        - operation completed successfully
 *       EP_RB_RECOVER_RPC_FAIL  - if comms with restore engine fail
 *       EP_RB_NO_PREV_CATALOG   - when at the first catalog
 *       EP_RB_RECOVER_PERMISSION_DENIED - when user cannot access the file
 *                                         of the new catalog

 * EDMRST_GetCurrentTemplate API
 *
 * Function Description:
 *  This routine returns the name of the template that is used by
 *       the currently selected top level object (work item) and the flag
 *       on whether or not the alternate trail is being used.
 *
 * Parameters:
 *       svrHdl          - (I) A pointer to this user's client handle for the
 *                             Restore Engine (server) connection.
 *       template        - (O) ptr to a preallocated template_name_ty
 *                             buffer
 *       alternate       - (O) ptr to a preallocate boolean_ty var
 *
 * Return Codes:
 *       E_SUCCESS       - operation completed successfully
 *       EP_RB_RECOVER_BAD_ARGS  - invalid input argument
 *       EP_RB_RECOVER_NO_CURR_TEMPLATE  - no valid current template
 *

/*****************************************************************
 * EDMRST_GetBackupServers:
 *
 *  This function is provided to allow retrieval, one at a time, of the
 *  servers which are configured to backup (and restore) this host.
 *
 *  The cookie must be initialized to INIT_COOKIE on the first call to this
 *  routine. This routine will update the cookie to allow retrieval of more
 *  server names if there are more than one.  The cookie will be
 *  returned as DONE_COOKIE when there are no more to retrieve.
 *
 * ********************  NOTE: **********************************
 * In this implementation, the restore gui can only run on the EDM server,
 * so only the current host can be the backup server.
                                                    When other configurations
 * are possible, i.e., multiple EDM servers are possible,
                                                        this function must be
 * updated to determine the possible servers.  Presumably,
                                                        this will be through
 * a call to the Dispatch Daemon, to get the list of EDM servers.  Then those
 * servers can be queried to see if the current (local) host is one of its
 * backup clients.
 *****************************************************************
 *
 * Parameters:
 *   hostname       (O)  - Pointer to buffer to receive the server name output
 *   cookie         (IO) - a place holder for the list position
 *                         meaningful to only the internals of the API
 *

 * EDMRST_MarkObject()
 *   This function is passed a restorableObject and begins to mark files for
 *   restoral based on the input criteria.  A second function,
 *   EDMRST_GetMarkResults, is used to test for completion of the mark.
 *
 * Parameters:
 *
 *  svrHdl      (I) - A pointer to this user's client handle for the
 *                    Restore Engine (server) connection.
 *  thisObject (I) - The input object to mark, must be of type file or
 *                    directory (not a top level object) .
 *    1) For files thisObject is the represents the target file to be marked.
 *    2) For directories thisObject represents the directory to be recovered
 *    and if the descend parameter is true then the mark applies to all the
 *    contents of the directory.
 *    3) For Witems thisObject an error condition will be returned.
 *
 *  time        (I) - (optional) the backup time to perform the mark on --
 *                    if not specified, uses currently selected backup; if
 *                    specified, leaves selected backup time unchanged
 *  allowBadfiles (I) - allows marking of files of state BADDATA.
 *  descend     (I) - Should mark operation descend to operate on the contents
 *                    of directories.
 *

/*****************************************************************
 * UnmarkObject() and GetUnmarkResults()
 *
 *   UnmarkObject operates like MarkObject, in that it is supported through
 *   two API calls -- UnmarkObject and GetUnmarkresults.  Unmark starts an
 *   asynchronous operation in the Restore Engine to perform the unmarking,
 *   and returns.
 *
 *   GetUnmarkResults is called to test for completion of the unmark operation,
 *   and receive results when it is done.  It can also be used to interrupt
 *   the unmark operation.
 *
 * UnmarkObject Parameters:
 *
 *  svrHdl          (I) - A pointer to this user's client handle for the
 *                        Restore Engine (server) connection.
 *  thisObject      (I) - The restoral object; can be a leaf object (e.g. a
 *                        file), or a container object (e.g., a directory).
 *  backupTime      (I) - (optional) the backup time to perform the unmark on --
 *                        if not specified, uses currrently selected backup; if
 *                        specified, leaves selected backup time unchanged
 *  BadFilesOnly  (I) - allows unmarking ONLY of files of state BADDATA.
 *  descend       (I) - Should unmark operation descend to operate on the
 *                        content of container objects.

 /*********************************************************************
  * Get Necessary Media:
  *
  *  This function is provided to allow retrieval of the
  *  necessary media to restore the currently marked objects.
  *
  *  The cookie must be initialize to INIT_COOKIE  on the first call to
  *  this routine. This routine will update the cookie to allow retrieval
  *  of more objects if there is more than "maxEntries".  The cookie will be
  *  returned as DONE_COOKIE when there are no more to retrieve.
  *
  * Parameters:
  *   svrHdl         (I)- a pointer to this user's client handle for the
  *                       Restore Engine (server) connection.
  *   maxEntries     (I)- the maximum number of media objects to return
  *   objects        (O)- an allocated array to return the objects in
  *   numberEntries  (O)- the real number of media objects returned in the array
  *   cookie         (IO)- a place holder for the list position
  *
  *********************************************************************/

 ** Copyright (c) 1998,1999 by EMC Corporation.
 **
 ** Purpose:
 ** -----------
 **       The intent of the contents of this file is to implement the
 **       functions the control execution of the restore for the Restore API.
 **
 **       These functions are provided to allow:
 **      - creation of submit objects, which define the set of objects to be
 **        restored and the scripts to be run before and after restoration,
 **      - starting the restoral of a submit object.
 **      - polling of the status of an ongoing restore,
                                                    including the ability to
 **        interrupt the restore, and to receive information necessary to
 **        query the user for input needed for the pre-restore or post-restore
 **        scripts, suspending, restarting,
 **      - supply of user responses to pre- and post- restore script queries
 **
 ** The following functions comprise restoral management:
 **
 **       EDMRST_Submit
 **       EDMRST_GetSubmitResults
 **       EDMRST_Start
 **       EDMRST_GetRestoreFeedback
 **       EDMRST_GetQuestion
 **       EDMRST_SetUserAnswer
 **
 **
 ** Compile-Time Options:
 **              This section must list any compile time definitions
 **              which will affect this header.
 **

 *
 *****************************************************************
 * Submit
 *
 * This function starts the creation or update of a submit object from the
 * currently marked restorable objects.  Its completion is tested for with
 * EDMRST_GetSubmitResults.  The returned submit object ID is passed to
 * EDMRST_Start to begin execution of the restore.
 *
 * Parameters:
 *
 * svrHdl       (I) - A pointer to this user's client handle for
 *                    the Restore Engine (server) connection.
 * policy       (I) - The overwrite policy to use
 * inPlace      (I) - Flag if the restoral is to be in original locations
 * hostName     (I) - host to restore to (only if inPlace == False)
 * directory    (I) - directory to restore to (only if inPlace == False)
 * transport    (I) - Indicator of transport the restoral is to be over (SCSI
 *                    or network)
 * submitObjID  (I) - ID of an existing submit object which is to be added to
 * socketClientNm (I) - Name of the client the restore is going to on
 *                      a client initiated restore
 * clientSocketPort (I) - the port to connect to on the client machine for
 * the restore

/*****************************************************************
 * Find Routine:
 *
 *  These routines allow the user to find restorable objects.  Returned
 *  is an array of found objects and an array of backup times associated
 *  with the objects.  These arrays are 1-to-1.  That is, the nth Object
 *  was backed up at the nth time.
 *
 *  This operation is performed asynchronously by the Restore Engine, and the
 *  first API function, EDMRST_FindRestorableObjects, is used to start the
 *  'find'.  EDMRST_GetFindResults is used to test for completion of the find,
 *  cancel the find, and receive the results (
                                        parts of, at least) if it is done.
 *
 * EDMRST_FindRestorableObjects Parameters:
 *
 *   svrHdl          (I) - A pointer to this user's client handle for the
 *                         Restore Engine (server) connection.
 *   searchCriteria (I) - The criteria used for the search
 *
 *
 * Return:
 *       E_SUCCESS
 *       EP_EB_RECOVER_FIND_BAD_USER
 *       EP_EB_RECOVER_FIND_BAD_GROUP
 *       EP_RB_RECOVER_FIND_FAILED
 *       EP_RB_RECOVER_BAD_ARGS
 *       EP_RB_RECOVER_FIND_INTERRUPTED
 *       EP_RB_RECOVER_FATALERR
 *       others
 *
